

## General rules for pallets handling & storage:

### Handling :

Pallets and products should be handled carefully.

Loading and unloading are crucial times when damage can be caused.

Plastic packages are sensitive to tearing and wooden pallets can break due to weight.

High pallets need special attention as the tops can hit the roof of the container door, causing the pallets to be damaged or even to tip over.

### Storing :

Goods must be store inside in a cool (ideally below 25°C), dry, aerated and dark storage area.

Products should be isolated from any form of potential contamination by plant diseases, insects or chemicals products.

Pallets must be kept away from any inflammable material or source.

Pallets and products should be used within 6 months of delivery.

Plastic packaging products are sensitive to direct sunlight.

High humidity can cause problems with expansion.

All information provided has been prepared using the best of our knowledge, experience and beliefs. Our information documents therefore make no claim to completeness and/or correctness. Notably, we reserve the right to make changes, and all application and usage recommendations must be understood as being non-binding guidelines and must be adjusted to meet local circumstances and code of practice. Store our product in a cool place, protected from direct sunlight and humidity, otherwise product guarantee is rescinded.
